DESIGN NOTE ON SKILLS TRACKER

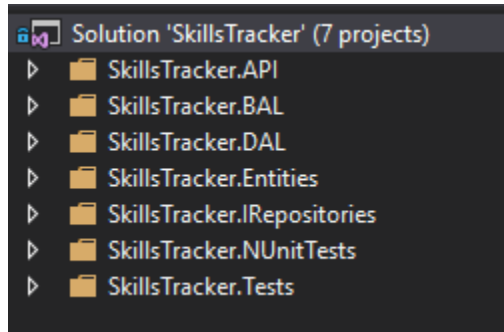

.Net FSD

Contents

Project Structure:.....	3
Skills Tracker – SPA:	6
Working Screenshots of Skills Tracker:	7

Project Structure:

The Skills Tracker Project implements a “Separation of Concerns” pattern for maintainability. The following sections details each concern’s functionality.

1. SkillsTracker.API:

This is a ASP.NET Web API project which acts as a bridge between the Single Page Application (SPA - built with Angular) and the database. The request is in the form of Data Transfer Objects (DTO) which is sent to the next concern which is the SkillsTracker.BAL.

2. SkillsTracker.BAL (Business Access Layer):

This is a class library which contains all the business logic of the SkillsTracker . The incoming data from the API request is tranformed into the Database entities and sent to the next concern which is the SkillsTracker.DAL.

3. SkillsTracker.DAL (Data Access Layer):

This is a class library which contains all the data access logic of the SkillsTracker. The layer implements Repository pattern to access the data via the Entity Framework.

4. SkillsTracker.Entites:

This is a class library containing POCOs which are used as entities (for Entity Framework Code First approach) in the Data Access Layer and the Data Transfer Objects for APIs.

5. SkillsTracker.IRepositories:

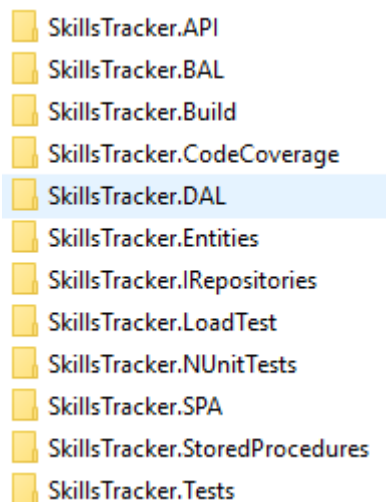

This is a class library containing the contracts for the Repository Framework.

6. SkillsTracker.NUnitTests:

This is a class library containing unit tests implemented using the NUnit Framework.

7. SkillsTracker.Tests:

This is a class library containing unit tests implemented using MSTest.

**8. SkillsTracker.SPA:**

This is an Angular project built with Angular CLI.

9. SkillsTracker.StoredProcedures:

This contains the database scripts for creation of the database, tables and also seeding the tables.

10. SkillsTracker.Build:

This contains the build scripts written in NAnt which integrates with CruiseControl.NET Continuous Integration server. The folder contains a Readme.txt file containing the guidelines.

11. SkillsTracker.CodeCoverage:

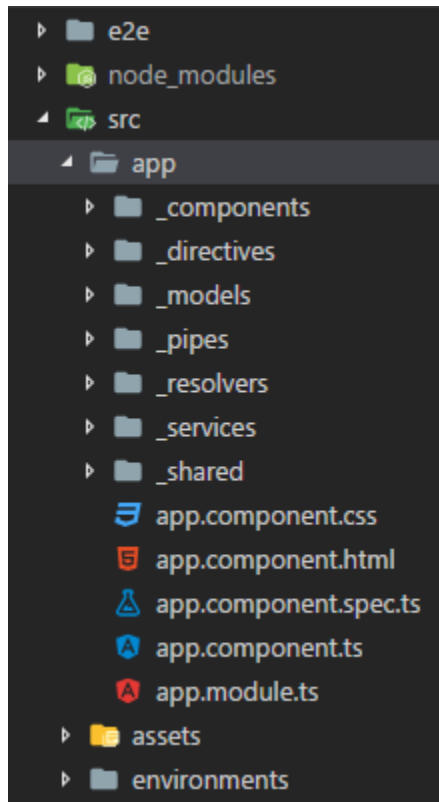

This contains the script for running Code Coverage. The Code Coverage report for Skills Tracker has been copied in the folder. The folder also contains a Readme.txt file containing the guidelines.

12. SkillsTracker.LoadTest:

This contains the Load Test Plan configured using JMeter whose instructions are given in the Readme.txt available in the folder.

Skills Tracker – SPA:

Skills Tracker is a Single Page Application built with Angular 5 and Bootstrap. Prominence have been given to adhere to the coding standards, structuring it into different modules (shown below), which is quite self-explanatory.
